Multi-layer Secure Document Encryption, Management and Delivery

## Protect your client's confidential legal information

### Securing sensitive client legal information, documents and attachments

As law firms increasingly move towards a paperless office to increase efficiencies and reduce costs, they have been challenged with client privacy concerns. Electronic documents have largely replaced physical media and paper as the preferred method for storage and transmission of documents containing legal briefs, contracts, and patent information. The increased reliance on email and electronic transfer of files and documents has challenged law firms to address the issues of client privacy and attorney / client privileges. With the use of electronic documents, the likelihood that sensitive legal information is viewed by the incorrect party via inadvertent email, network security breach, or during transmission via the Internet has increased significantly.

Today, many firms protect themselves with confidential disclaimers within documents or emails. However, once a sensitive legal document has been opened and viewed, the privacy of the communication has been compromised. Therefore, it is increasingly important that law firms adopt an easy-to-use encryption technology that is capable of controlling access to confidential information.

By implementing SmartSoftKey's AMPLock™ solution, a law firm can be assured that any sensitive legal information will remain secure and protected. By using a high-level, 256 bit encryption scheme and a complex algorithm that generates a unique ID, AMPLock™ ties documents to a specific user(s). Documents are kept secure both inside the network and outside the firewall. Authenticity of the intended recipient is verified instantaneously when the protected document is opened, leaving the decryption process completely transparent to the end-user.

### Features At-A-Glance

- Easy-to-use document security interface.
- Protect any electronic file type including Word, PDF, Excel, PowerPoint, and media files, among others.
- Encrypt & send functionality to automatically send encrypted documents via Outlook and GroupWise.
- Time-lock documents for "auto-shredding" capabilities.
- Multi-layered security with 256-bit encryption.
- Minimal time and effort required for the implementation and ongoing maintenance.

### Secure Document Delivery

#### AMPLock™

Author protects a selected document and locks it to the intended recipient. The file can then be saved to a network folder or sent as an email attachment.

#### Internet / Network

Multi-layered security prevents tampering or unauthorized opening of the AMP-protected document whether it resides on a file server inside your company's network or sent over the internet as an email attachment.

#### AMPKey™

File is verified on-the-fly at the recipient's PC when the document is opened. After the AMP plug-in is initially installed, the unencryption process is instantaneous and completely transparent to the end user.
